

6. Test Summary

1. Testing performed

Exploratory and functional testing was performed on the AbleSpace staging application using fictional test data. The tested areas included account creation, onboarding, Caseload, student search and filtering, adding/editing students, View Data, goal creation/updating, data persistence and refresh behavior. Testing was performed on Google Chrome desktop, Firefox desktop, Chrome DevTools mobile emulation at 390 × 844 and iPad Mini emulation using Chrome and Firefox.

2. Issues found

A total of 3 detailed bugs were reported. BUG-01 is a layout overlap in the onboarding feature-selection screen, BUG-02 is incorrect handling of leading/trailing whitespace in student search and BUG-03 is the loss of View Data context after refresh. I would fix BUG-03 first because it affects the user's current workflow and causes the application to redirect from View Data to Caseload after a refresh. Additional responsive usability issues were also observed during cross-browser testing.

3. Areas not tested

Actual mobile-app testing was not performed because the assignment did not provide a specific application name or Google Play/App Store link. iPad Pro emulation was not tested. Security, load/performance testing and destructive actions were intentionally not tested as part of the assignment scope. Real student data was not used, only fictional data was used.

4. What I would test next

If I have 1-2 more hours I would test goal filters and the Take Data action in Caseload, verify search and filter combinations and check data persistence and navigation. I would also complete iPad Pro testing and retest responsive issues across devices.
